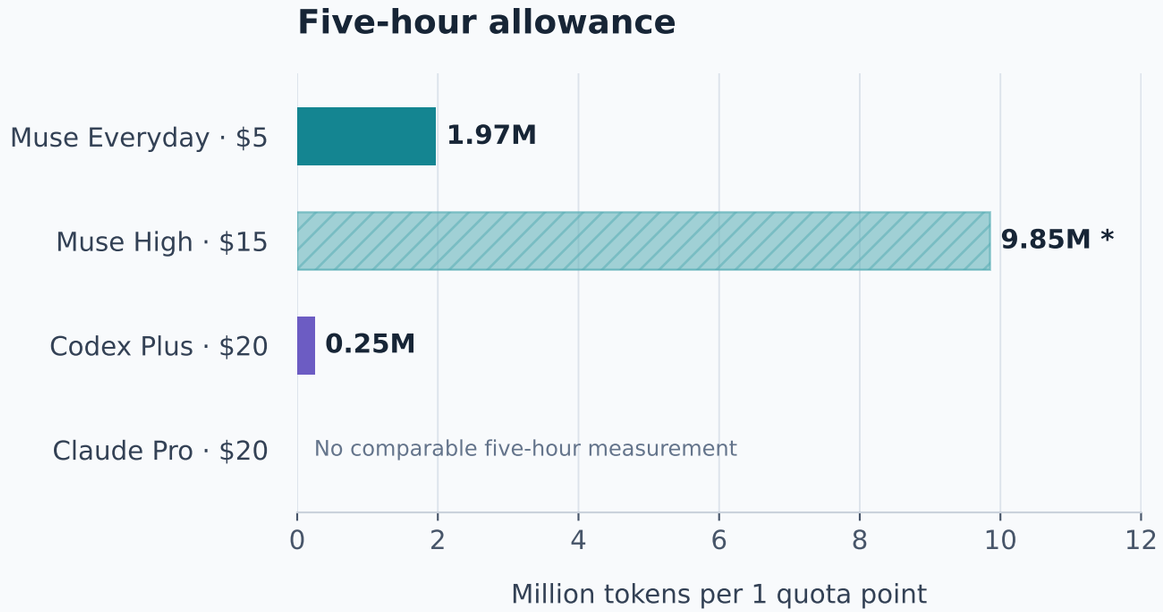
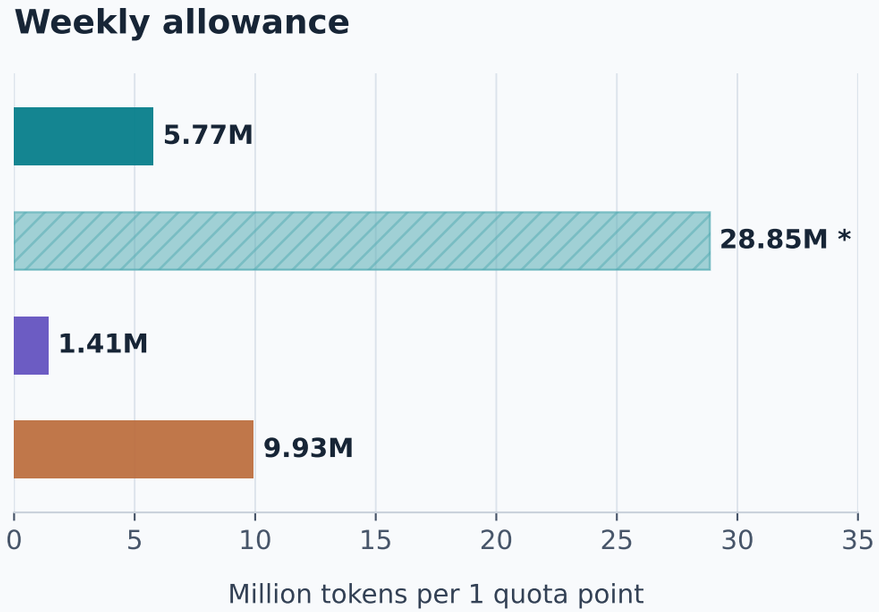
How many tokens did each quota point buy?

Observed context throughput • millions of input + output tokens per 1 percentage point

More tokens per point = more recorded throughput. This does not measure task quality.





MEASURED WINDOW

22 Oct, 12:10–14:06 UTC: Muse 80.79M tokens / +41 five-hour points / +14 weekly points;
Codex 5.65M tokens / +23 five-hour points / +4 weekly points.

* Muse High is a 5× allowance projection, not a measurement. Claude uses 20 Oct: 268.07M / +27 weekly points. Cache-heavy, different tasks and models; background reviews included. Gemini lacks a comparable token/quota pair. Rounded account meters and reporting lag make these approximate workload-specific rates, not fixed token allowances.
